Content based signatures

Semantic Firewall

## University of Geneva

Data Analysis / Semantic Extraction

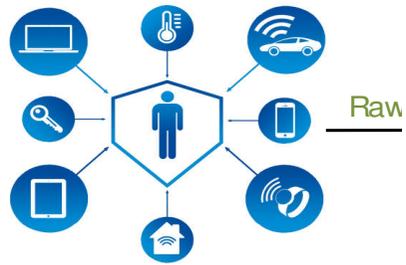

## University of Essex

ICMetric technology, Demonstrator integration

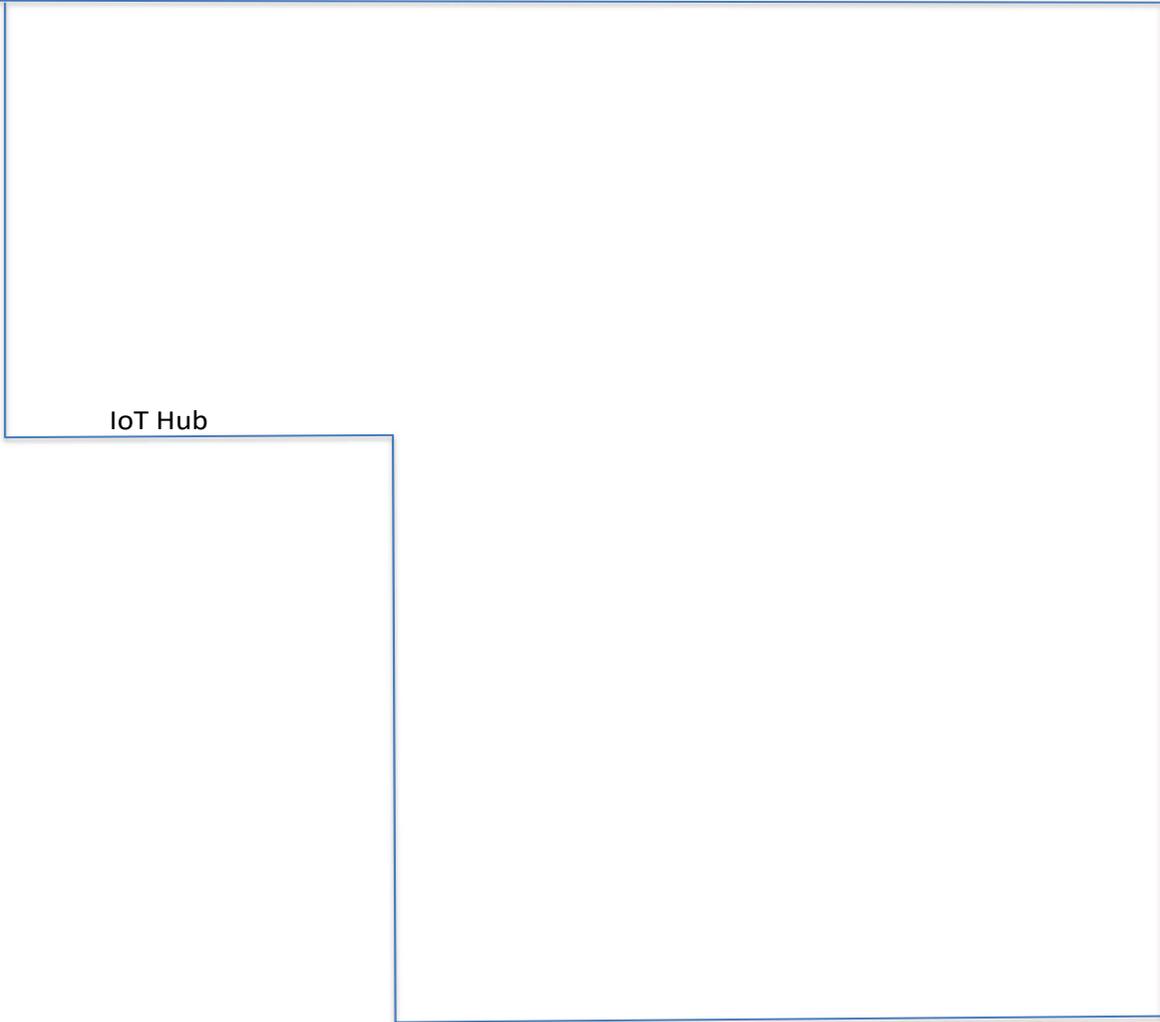

# Background

- Enhance trust and integrity of IoT technology
- Address lack of user confidence in the technology
- Specifically
  - How to ensure data originates from claimed device?
  - How to ensure it has not been altered?
  - How to ensure users comply with security requirements?
  - How to ensure the solution is easy and cheap to deploy?
  - How to ensure system may evolve to changing requirement?

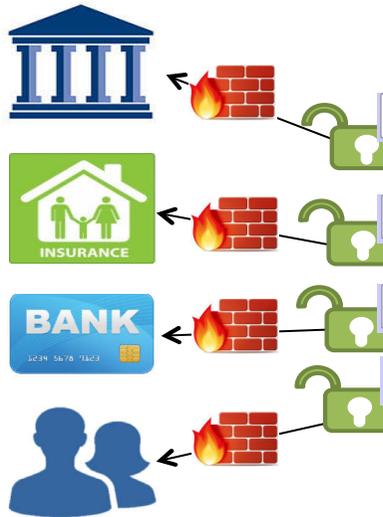

# System Overview

User's IoT devices  
Data producer

IoT Hub

Data consumers

## WP1: Project Management

### WP2: Content-Based Signature

2.1 Data extraction

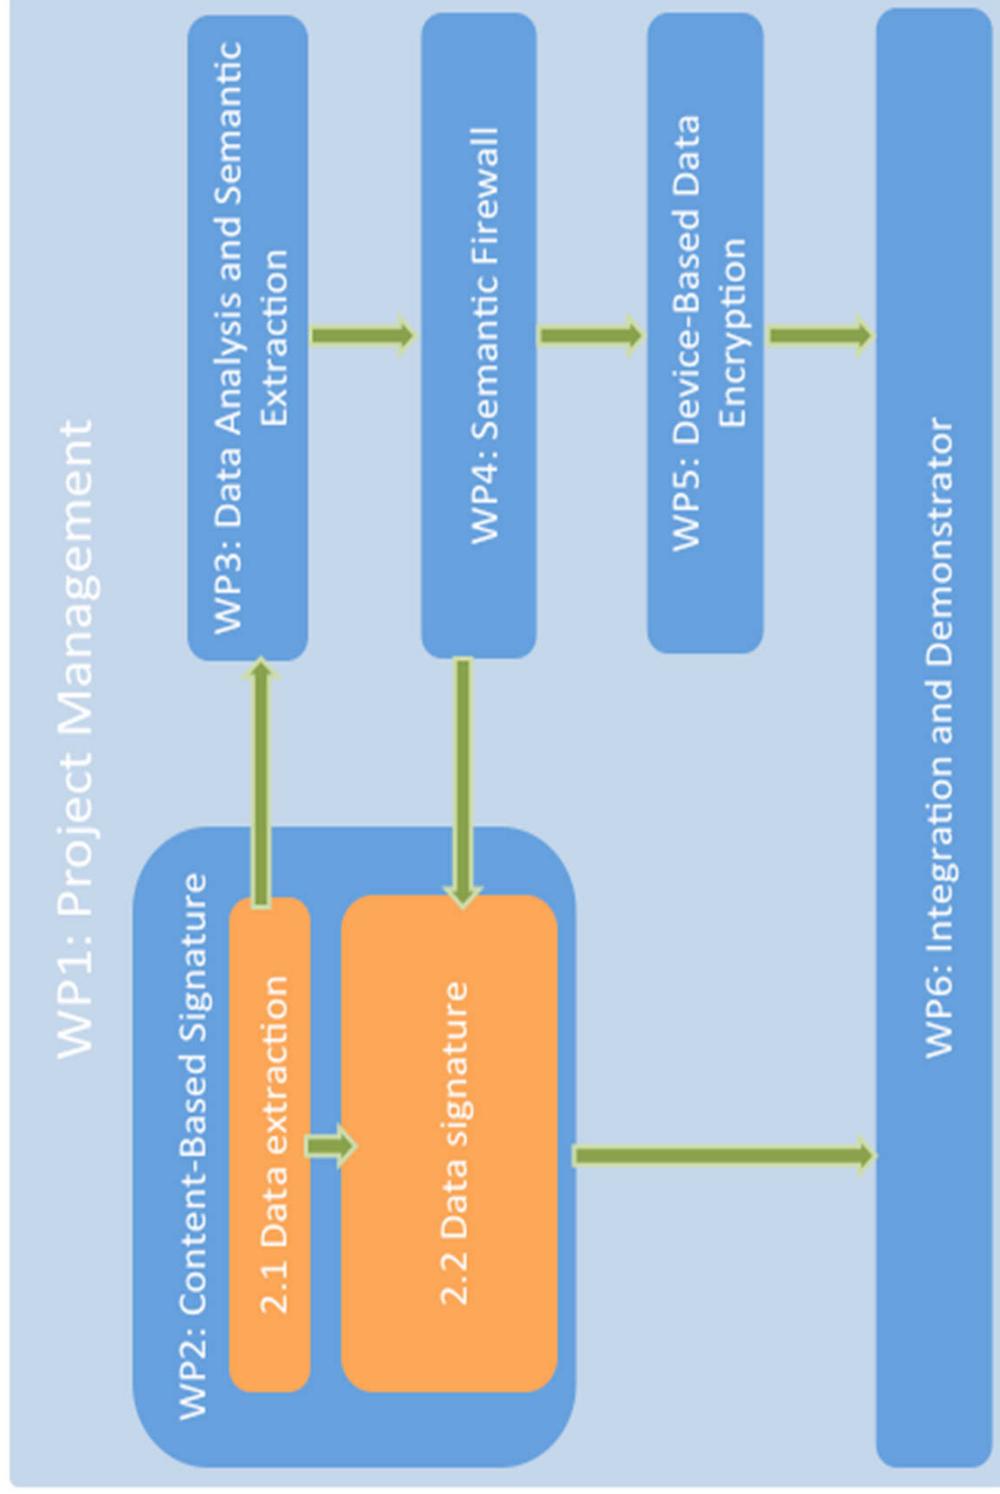

2.2 Data signature

WP3: Data Analysis and Semantic Extraction

WP4: Semantic Firewall

WP5: Device-Based Data Encryption

WP6: Integration and Demonstrator

# WP2 – Content-based Signature

**Partners: Univ. La Rochelle + Univ. Geneva**

## **Main goal:**

- Computing a unique content-based signature using the content of IoT device data
- First year
  - Decomposing the layout of a document in order to separate the different content composing a page
  - Proposing a layout descriptor based on this decomposition
  - Hiring a post-doc

# WP2 – Content-based Signature

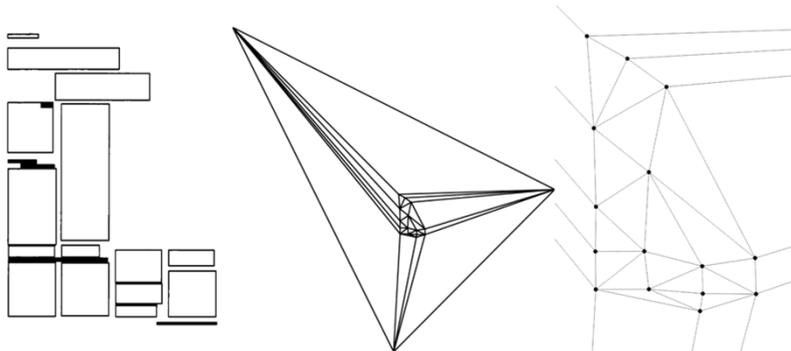

## Task 2.1: Data Document analysis: layer decomposition

- First step: Identifying the regions of a document
- A survey has been done to highlight the variety of the approaches since 2008
- We identified that the physical layout of a document refers to the physical location of various regions in the document image

## Task 2.2: Classification and extraction of content

## Task 2.3: Testing and optimization of data extraction

- This work has started lately
- Design of a layout descriptor without any threshold
- Creation of a new public dataset for forgery detection and spotting for the validation process

## Dataset

Payslip-like documents.

5 fonts, 4 text sizes

20 pairs generated

Fixed layout, different data:

# Objectives or Work-Package WP3

Partners: Univ. Geneva + Univ. La Rochelle

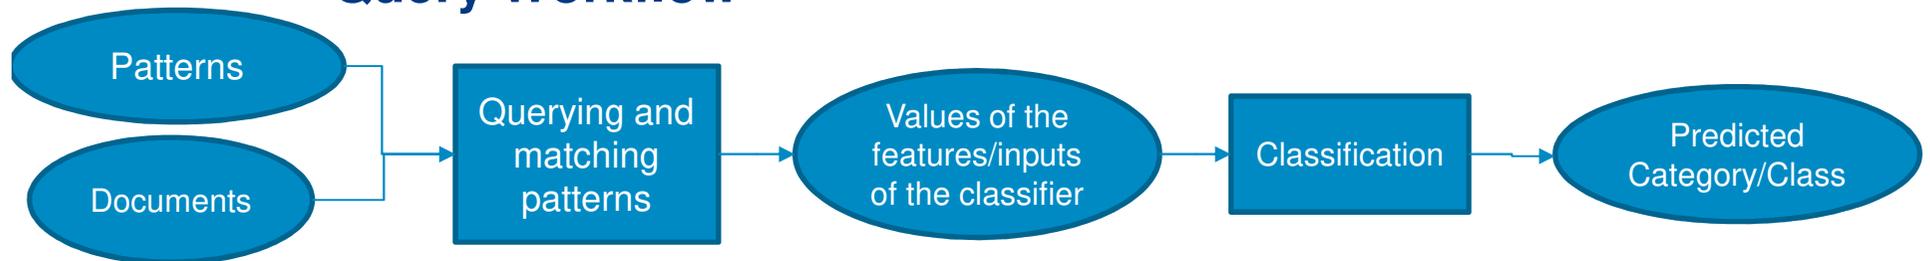

Objectives	Document Analysis (for each <b>category</b> of <i>Documents</i> )	Knowledge Extraction (for each <b>category</b> of <i>Knowledge</i> )
Preprocessing	X (only once for a given corpus)	—
Pattern Extraction	X	X
Querying and Matching patterns	X	X
Training a classifier and model selection	X	X
Testing the chosen (the selected/best model) model/classifier	X	X

# Workflow WP3

## Analysis Workflow

## Query Workflow

# Summary of work-package WP3

Task	Description
Document Preprocessing	<ul style="list-style-type: none"><li>• Cleaning the corpus;</li><li>• POS tagging, deep syntactic analysis.</li><li>• Transforming our data into sets of sequences;</li><li>• Dividing the original dataset into (I) a training dataset and (II) a testing dataset.</li></ul>
Pattern mining (for Feature Extraction)	<ul style="list-style-type: none"><li>• Pattern mining algorithm for extracting <a href="#">frequent</a> and maximal patterns satisfying gap constraints provided by the user.</li></ul>
Pattern matching for querying purposes	<ul style="list-style-type: none"><li>• Finding which patterns are included in a sequence.</li></ul>
Feature selection	<ul style="list-style-type: none"><li>• Extracting patterns that are representative of a class of documents;</li><li>• Using FCA (<a href="#">Formal Concept Analysis</a>) to identify the most discriminative sets of patterns.</li></ul>
Classification	<ul style="list-style-type: none"><li>• FCA-based classifier;</li><li>• Neural network classifier.</li></ul>

## Work-package 4

**Partners: Univ. La Rochelle + Univ Kent + Univ Essex**

Design and implementation of a semantic firewall based on a user-centric approach for personal data protection and privacy preservation within an IoT environment

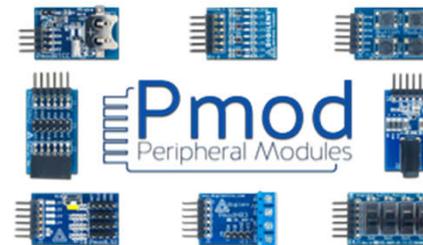

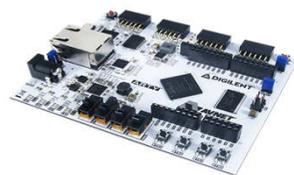

- Rules for Personal Data Protection
- Privacy Knowledge Base Description
- Privacy Policy Infringement Detection & Protection
- Reasoning mechanisms for access control

# Objective of Work-Package WP5

Partners: Univ Kent + Univ Essex

To develop practical and secure technologies for IoT devices, which lock-down the communication between the semantic firewall and IoT devices on its network.

Task		Acomplishments
5.1		<ul style="list-style-type: none"><li>✓ Programmable embedded platform developed</li><li>✓ Various IoT Sensors investigated: MEMs gyros, accelerometers, ambient light sensors, etc.</li><li>✓ Signal processing techniques developed and investigated to stabilise readings</li></ul>
5.2		<ul style="list-style-type: none"><li>✓ Mathematical model derived to validate and model the data sets based on the Fisher transform and Probability Central Limit theorem.</li></ul>

# Summary

**WP1:** Management ongoing

**WP2:** First results available. Improvements in progress

**WP3:** Document Classifiers complete

Alternative analysis underway

**WP4:** Rules definition commenced

**WP5:** Sensor analysis completed. Mathematical model  
developed

**WP6:** Not yet commenced
